5	Received: 8 December 2014 Accepted: 3 January 2015 Published: 15 January 2015

7 Abstract

The core purpose of this article is to investigate how different a Norwegian subscriber?s point 8 of view about the terminology of understandability, technicality, importance and awareness of 9 privacy policy. Indeed this research article has its demographic limits and was targeted for 10 Norwegian clients but it may suggest a first step to reshape policy for better realization. The 11 emerging ambiguity in information security has raised much privacy and trust issues that are 12 context dependent. Therefore there are several uncertainties and risks seen today concerning 13 the privacy policy subscriber trust. It is a responsibility of services providers before amending 14 their policy to notify their subscribers. Since if they do not take this initiative then it creates 15 trust deficit for their subscribers and this affects their business and goodwill. For this article 16 we have adopted a survey questionnaire methodology based on clients? own perspectives. 17 Generally observed that, before accepting privacy policy, it's hard to read these policies and 18 understood by common user, and taking this prospect ahead, many policies regulations have 19 a difficult context to recognize. 20

21

Index terms— privacy; personal information; service providers; subscriber's policy; issues; legislation; practices; information security.

24 1 Introduction

ore than a century ago, Warren & Brandeis have defined privacy as "the right to let alone" and their concern 25 about privacy was quite prompted [1]. The emerging ambiguity in information society has raised many privacy 26 and trust issues that are context dependent. These issues will pose many challenges for policy-makers and 27 stakeholders because people's notion of privacy and trust are different and shifting [2]. Policies are considered 28 as a fundamental factor to provide security and privacy in applications such as, file sharing, web browsing, web 29 publishing, networking, and mobile computing. Such applications demand highly accurate policies to ensure that 30 resources remain available to authorized access but not prone to compromise. The policies of the past are not 31 suited to deal with new challenges and we are probably entering into new era that would require developing more 32 effective policies. There are lots of uncertainties & risks today concerning our privacy & trust. It is also seen that 33 34 people are sometimes compelled in circumstances to surrender their personal data to gain something [2]. Two 35 non-expert groups of policy authors are on the rise. First are the non-technical enterprise policy authors, typically 36 Author: Member IEEE, Oslo Norway. e-mail: terminate1@hotmail.com lawyers or business executives, who have the responsibility to write policies governing an enterprise's handling of personal information [3]. Second are 37 endusers, such as that wish to set up their own spam filter, share photographs, videos or important files with 38 friends but wants to protect them from un-authorize access [4]. It is important to continue researching better 39 mechanisms for security & privacy policies authoring and to establishing good guidelines; because to achieve 40 the best security goals it's crucial to obtain high quality to ensure the intended policy. This work shows the 41 current role of privacy policy in policy management, but it is still immature in making security analysis and 42

assessments [5]. Furthermore with this research, the interest to make the organizations flexible with respect to
 privacy matters, consistent over the design of policy language that could be enforceable.

45 **2** II.

46 **3** Background Realities and Issues

This section is laid down to get a good basis for specifying the ground of this area and creates a sense about the level of clients' concerns on privacy policy.

$_{49}$ 4 a) What are privacy policy and security trust issues?

Privacy policies are meant to protect the privacy of the user: they need to reflect current regulations and possibly 50 promises made to the customers. "A privacy policy is a legal document that discloses some or all of the ways 51 a party gathers, uses, discloses and manages a customer's data. The exact contents of a privacy policy will 52 53 depend upon the applicable law and may need to address the requirements of multiple countries or jurisdictions" 54 [6]. While there is no exact universal guidance or recommendations for the content or text of specific privacy 55 policies, a number of organizations provide example forms, templates or online consultant for this purpose [6]. 56 Privacy policies arise further issues in comparison to access control policies, as they require a more sophisticated treatment of deny rules and conditions on context information; moreover privacy policy languages have to take 57 into account the notion of "purpose", which is essential to privacy legislation [7]. "A subset of privacy policies 58 are enterprise privacy policies which furthermore have to provide support to more restrictive enterprise-internal 59 practices and may need to handle customer preferences" [7]. This means that an enterprise level privacy policies 60 plays a vital role to increase the loyalty with the users. 61

$_{62}$ 5 Year ()

H b) Is a policy context difficult with typical legal jargon? Many researchers of system security are asking the 63 question; why do few people read the privacy policies [8]. One common fact is simply that policies are often 64 written in a hard and complicated language which a common user or subscriber cannot understand [8], [9]. In 65 privacy notice research conducted by [10] the research is conducted in 2001 and in that research, 29 percent of the 66 respondents expresses their feelings that policy contents are very difficult to read and 45 percent of respondents 67 said that it was difficult to understand them. Another good reason subscribers have given for not understanding 68 the policy is that they contain a lot of legal and lawful jargon [10]. In the survey by Milne [11], about 53 percent 69 of the respondents agreed, or strongly agreed to, that privacy notices often use legal language which is very hard 70 to understand or is confusing for most people. Same as described in [12] those policies use certain statement and 71 distinct vocabularies which made them very hard to understand, even for the experienced reader. 72

$_{73}$ 6 c) What is the standardization of policy context?

Lack of standardization of privacy policy contents is also a problem. Different websites use different ways for 74 structuring the information in their policies. Many service operators claim that their security statement first 75 explains what particular information they are collecting and then how they will use those details [13]. Other 76 service operators tells where on the website they would collect personal information, and then explain what they 77 will do to protect this information [13]. Some service operators post on their website F.A.Q (Frequently Asked 78 Questions) format focusing on answering the most common questions that mostly asked by the users regarding 79 their privacy [13]. There is no particular standardization adopted across the organizations / companies for 80 comparison [12]. The ability to compare policies could be helpful in many situations (e.g. where users have a 81 chance to select a company /organization to fulfil its requirements on privacy and security). 82

$_{33}$ 7 d) What are the main privacy concerns?

84 The privacy threats of which people are concerned include;

i. Visit to the websites will be tracked secretly without informing the user [16]. ii. E-mail Id's and other 85 official information will be stored and used for marketing, publicity and other similar purpose without permission 86 of the user [16]. iii. Personal information will be sold to third parties without getting permission from user [16]. 87 The advances of internet & database technologies increase information privacy threats. Data entered into forms 88 89 or contained in existing databases, can be combined almost effortlessly with banking transaction records, and 90 records of a user's every click of a mouse on internet. Privacy concerns increase further as data mining tools 91 and services become more widely available [17]. There is a potential for fraudulent activities on the internet, 92 as few regulatory standards exist [18]. The security of banking card information for online purchase is also incorporated with the privacy concerns. Amazon.com admitted that hackers undetected over four months have 93 stolen about 98,000 bank card numbers. Hackers from time to time publish a list of stolen card numbers and 94 related information over the internet [18]. The information without permission may lead to a fraud, which has 95 very serious consequences [17]. Although personal information may not be used after collecting them, it must 96 be noticed that keeping information is a liability for a website when it meets some good consumers or some old 97

users that take the safeguard of their privacy seriously. The Internet based businesses should take good care of
the privacy concerns because the common consumer does not really care about going through every line of policy
context. Surveys show that people are more comfortable if they see privacy statement has been approved by a
third party, such as Trust-E ??19], [20].

¹⁰² 8 e) How client's trust on security policies?

Just like other studies have discussed on users' trust on privacy statements, a study conducted by [21] also 103 discovered that respondents were most willing to provide information with a strong privacy statement. Based 104 on the responses for providing personal information, it appeared that many Internet users would be unwilling 105 to provide personal information online, except when offered a strong policy statement. In this context, the 106 importance of the privacy policy becomes apparent. It is the only way a website can communicate privacy issues 107 with the users. The article [21] concludes by showing strong concern for the low percentage of policy readers, 108 given the impact that such statements would purportedly have on consumer trust. It has however been found that 109 consumer trust relies on other aspects than the privacy policy. Studies have found that users tend to not read the 110 whole privacy policy because they gained trust to the company through previous experience [22]. Almost half 111 of the respondents in the study by [11] agreed or strongly agreed; when asked if they did not read the privacy 112 policy because of pervious offline experience with a company and just 25 % disagreed. Similarly in the same 113 study 45% agreed that they do not read the policy contents if it belongs to a well known organization or by a 114 well repudiated service provider. In a 2000 survey, about 66% responded that they got increased confidence in a 115 site if a privacy policy was present [23]. In other words, by just seeing a privacy policy posted some users may 116 believe that the sites they are visiting are safe in terms of privacy. They may also naively believe that "a security 117 policy exposes a website to 118

¹¹⁹ 9 Global Journal of C omp uter S cience and T echnology

Volume XV Issue I Version I Year () H potential legal action; a website will always adhere to its policy" [23].
These findings can be related to that some users believe policies are all the same, look like and have same context and that just by seeing it posted could make them believe its content is similar to other polices.

123 **10 III.**

124 11 Primary Privacy Principles

We will see that different approaches to regulate privacy protection has led to a global patchwork of privacy 125 laws, regulations and enforcement mechanisms which vary greatly from state to state, region to region, adding 126 complexity to the privacy landscape. Many of the laws and regulations enforced today do however have something 127 in common which is that they are based on privacy principles and guidelines developed over past 40 years. 128 a) Fairness and lawfulness: This principle implies that personal information should be handled fairly and 129 lawfully. Behind this important principle is a requirement that the data controller should respect and take 130 into consideration the data subject's interests and reasonable expectations. The data subject should not be 131 forced to submit personal information or to accept that this information is used to other specific purposes [24]. 132

¹³³ 12 b) Limitations on collection:

The basic purpose of this principle is to limit the amount of data collected to what is necessary to carry out 134 further processing of the data which corresponds with OECD's collection limitation principle. In [24] the authors 135 mention that there is not enough reason that the information is useful, the information must be necessary. 136 The further processing of data should correspond with the purpose of which the data was collected for [24]. 137 c) Purpose binding: This principle means that personal information should be handled to a stated, legitimate 138 purpose and should be handled to this purpose only. The purpose should be stated in a reasonable accurate way 139 not later than at the time the information is collected, which complies with the purpose specification principle 140 and the use limitation principle of OECD [24]. d) Quality of the information: This principle is concerning the 141 quality of the information. The information should be correct compared to what the information is supposed to 142 represent [24]. The information should also be relevant, adequate and complete based on the purpose of which 143 the information is to be used, and to be up to date, which correspond with the data quality principle of OECD 144 [24] . e) The co-determination: This principle implies that the data subject should to a certain degree be able to 145 participate and influence other's processing of information concerning it [24]. Persons can decide themselves if 146 147 personal information about them is to be collected by others and for what purpose, unless the collection is done 148 by the legal authority. This implies that persons can oppose to some types of processing of personal data, such 149 as personal marketing etc [24].

f) Security safeguards: The confidentiality and integrity of personal data should be protected by reasonable security safeguards. Confidentiality here means protection of personal data from unauthorized access or disclosure, and protection of integrity means protection against unauthorized destruction, use and modification of personal data [24]. g) Data sensitivity: Certain types of personal information are more sensitive for the data subject than other personal information. This is mostly information concerning the data subject's health, sexuality, race or ${}^{155} \quad {\rm ethnical\ background,\ political,\ religious\ or\ philosophical\ opinions,\ or\ memberships\ in\ certain\ type\ of\ organizations}$

 $_{156}~$ (e.g. Trade agreements, unions, joint business strategies etc).

¹⁵⁷ 13 IV. Methodology and Evaluating Results

We circulated a questionnaire to the peoples that are working & living in Norway. This response was collected by 158 sending 4 times reminder on different working days via email and messages to fill out the survey. Approximately, 159 81 percent incorporate their opinions about the privacy and security issues that have risen in this research. About 160 19 percent rejected or did not try to record their response. Around 30% of the respondents don't read the context 161 because they don't understand them or has no time to read the policy before getting registered. Only 20% of 162 the respondents have voted that they read the contents of the privacy policy when they are registered as a new 163 subscriber. The basic purpose of this question was to analyze how important a privacy policy for a subscriber, 164 whenever they register and give their personal information to the service provider. In this question we have 165 asked from our survey participants how difficult they feel when they read the policy content. By looking at fig 166 5, shockingly majority (46%) of the total respondents are feeling problem in understanding the content of the 167 privacy policy. 19% of the respondents have informed us that they have not ever read & understand the privacy 168 context before using the services. Lastly, just 35% of the respondents do not feel any difficulty in understanding 169 the context of the privacy policy. 170

¹⁷¹ 14 Global Journal of C omp uter S cience and T echnology

Volume XV Issue I Version I Year () of the respondents agreed that they are not at all relevant from them. 172 Around 30% of the respondents says that policy contents are useful whenever they registered and relevant for 173 them. Finally we can see that round about 28% of the survey respondents has no any idea about the relevancy of 174 these privacy policies from the subscriber point of view. We have asked from our participants to what extent they 175 176 are confident enough to give their personal information to a service provider. We analyzed the results as shown in fig 7 that 81 percent of the respondents are not confident to give their personal information to the service 177 provider and just 19% of the respondents are confident to give their personal information to the service provider. 178 Finally, we have asked from our participants that whether they are aware whenever their service operator amends 179 the privacy policy on website or on any other platform of communication. 180

The results are given in fig ??. It was shocking that majority of the respondents (81%) are not aware when there is any amendments performed by their service provider. According to our research survey just 19% of the respondents are aware when there are any amendments from the service provider. V.

185 15 Limitations & Trends

As seen from our evaluations, future approaches to alternative ways of presenting privacy policy are quite limited. 186 While the idea of a unified policy and regulation on the topic of privacy and is unlikely to ever happen. The 187 development of data protection laws throughout the globe is promising, and could create a better foundation of 188 taking the user into confidence, and creating innovative ways of presenting privacy policies in the future. There 189 have, however, emerged several interesting topics regarding privacy policies through this online web survey, 190 and especially the different aspects that defines user confidence in sharing online information seems fruitful to 191 base future research on. Further analysis in modifying the version of privacy seals could also be interesting to 192 investigate further. Being a self-regulatory approach, the idea of how this approach could effectively work in the 193 context of defined legislation can be a positive aspect for further study. 194
